

CROP SCOUTING- HORTICULTURE + PROFESSIONAL RECORD KEEPING

With FS PARTNERS Crop Scouting, our eyes are in your field at the important times. We can help to identify economic risk throughout your fields from pests such as weeds, insects, disease and other disorders including nutrient deficiencies, weather or herbicide injuries. These observations are included in a professional report sent to you, the grower, and recorded to track your field's history, along with making future recommendations for your crop. Any issues found are all geo-referenced in your report, logged for continuous monitoring, and evaluated for the effectiveness of any control measures taken.

FS HORTICULTURE SCOUTING

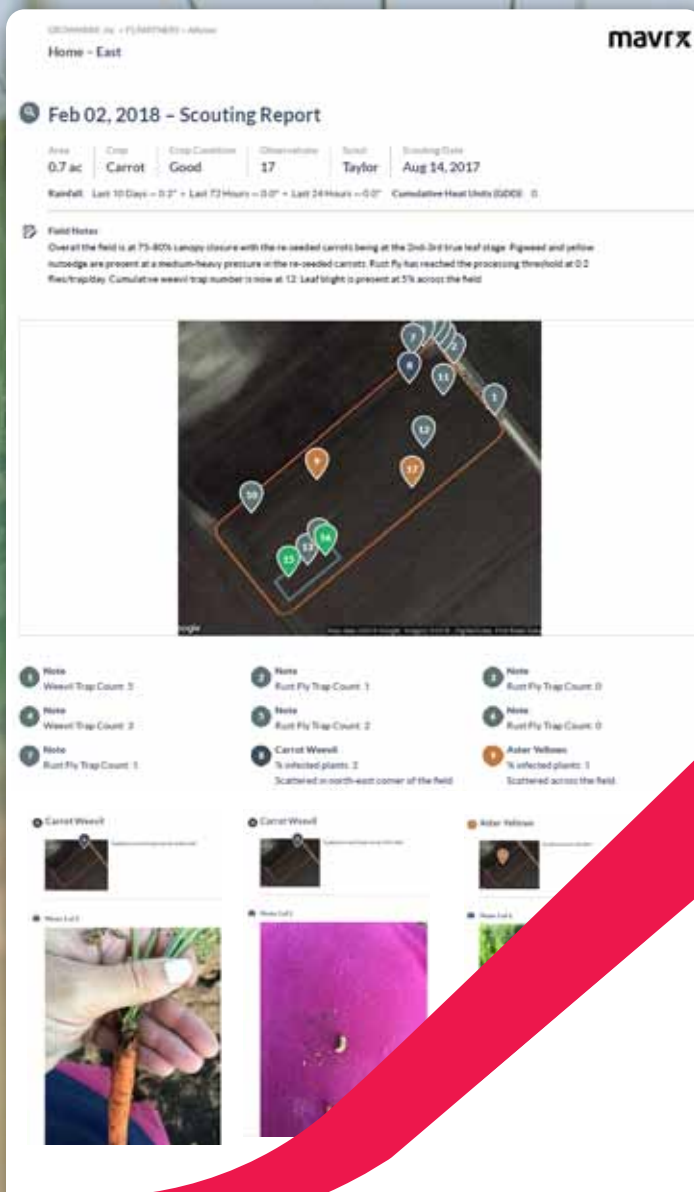

Carrots: Monitor boivin and orange sticky traps for carrot weevil, carrot rust fly and aster leafhopper thresholds. Monitor and assess leaf blights and other diseases.

Onions: Monitor the plants for thrips & diseases such as stemphylium, botrytis leaf blight, downy mildew and white rot.

Celery: Monitor orange sticky traps for aster leafhopper and sweep net counts for tarnished plant bug thresholds. Monitor and assess diseases such as: septoria late blight, celery leaf curl, fusarium yellows and pink rot.

Potatoes: Monitor insects such as colorado potato beetle, potato leafhopper, tarnished plant bug, potato flea beetle and aphids at various sampling sites and utilizing sweep net counts. Monitor for various yield limiting diseases such as late and early blight, brown spot and white mold and many others throughout the growing season.
